

A \$2.75 BILLION BETTER OPTION TO BACK SURGERY

Spinal manipulation was proven just as effective as microdiscectomy (surgery) for patients experiencing sciatica secondary to lumbar disk herniation.*

More than 200,000 microdiscectomies are performed annually in the United States, at a direct cost of \$5 billion, or \$25,000 per procedure.** If cost is assumed at \$100 per chiropractic visit, there is a direct, total savings of \$22,900 per manipulation patient. System-wide, this could save \$2.75 billion dollars annually.***
